

Introduction  
CS 239  
Computer Security  
Peter Reiher  
January 12, 2004

CS 239, Winter 2004

Lecture 1  
Page 1

Description of Class

- Topics to be covered
- Prerequisites
- Grading
- Reading materials
- Projects
- Office hours
- Web page

CS 239, Winter 2004

Lecture 1  
Page 2

Topics to Be Covered

- Cryptography and authentication
- Design of secure protocols
- Network security – threats and countermeasures
- Secure operating systems design
- Encapsulated environments
- If time permits, other neat stuff

CS 239, Winter 2004

Lecture 1  
Page 3

Prerequisites

- Must have taken CS111 and CS118, or equivalents
- Desirable to have taken an advanced OS course and advanced networking course

CS 239, Winter 2004

Lecture 1  
Page 4

Grading

- Midterm – 25%
- Project – 50%
- Final – 25%

CS 239, Winter 2004

Lecture 1  
Page 5

Class Format

- Typically we'll start each session with a discussion of material from last session
- Followed by lecture on new material
- Always feel free to stop me for questions or interesting discussions

CS 239, Winter 2004

Lecture 1  
Page 6

## Reading Materials

- Textbook
- Non-required supplemental texts
- Papers and web pages

CS 239, Winter 2004

Lecture 1  
Page 7

## Textbook

- *Computer Security: Art and Science*
  - By Matt Bishop
- Should be available in UCLA bookstore
- First reading assignment: Chapter 1

CS 239, Winter 2004

Lecture 1  
Page 8

## Supplemental Text 1

- *Applied Cryptography*
  - By Bruce Schneier
- Only covers what its title implies
  - And, as Schneier himself argues, there's a lot more to security
- But an excellent book on its subject

CS 239, Winter 2004

Lecture 1  
Page 9

## Supplemental Text 2

- *Secrets and Lies*
  - Also by Bruce Schneier
- Not a textbook at all
- More a well-argued philosophy of computer security
- Great for appreciating the field and problems
- Not great for depth of technical details

CS 239, Winter 2004

Lecture 1  
Page 10

## Papers and Web Pages

- Usually one paper per week and a couple of web pages
- Usually made available electronically
  - Through class web page
- Material in papers might or might not be lectured on
  - But it can appear on tests, regardless

CS 239, Winter 2004

Lecture 1  
Page 11

## Projects

- Either individual or small group
  - Depending on size of class
- Usually requiring program development
- Related to some topic covered in class
- Must be approved by instructor

CS 239, Winter 2004

Lecture 1  
Page 12

## Choosing a Project Topic

- Submit a 1 page proposal
  - By end of 3<sup>d</sup> week of classes
  - Email submissions OK
- I will approve them and offer suggestions
- Must be submitted, but not part of grade

CS 239, Winter 2004

Lecture 1  
Page 13

## What Makes a Good Project?

- Something new
- Something you're interested in
- Maybe it can turn into a paper for you
- Feasible to demonstrate something interesting within the quarter
  - Running code or other practical demonstration, not just a paper

CS 239, Winter 2004

Lecture 1  
Page 14

## Possible Project Topics

- Security for Internet infrastructure
- Security for ad hoc wireless networks
- Security for peer systems
- Intrusion and insider threat detection
- DDoS and worm defense mechanisms
- Innovative denial of service vulnerabilities
- Security for sensor networks
- Security evaluations of local labs

CS 239, Winter 2004

Lecture 1  
Page 15

## Project Updates

- Due at the end of the 7<sup>th</sup> week of class
  - February 27<sup>th</sup>
- 1 page report on your group's progress on its project
  - Email submission OK
- Not graded, but required
  - And should describe actual progress

CS 239, Winter 2004

Lecture 1  
Page 16

## Project Reports

- Written report on the project
- Should:
  - Describe project
  - Discuss how project was performed
  - Cover difficulties and interesting points
  - Describe the implementation
- Expected to be around 15 pages

CS 239, Winter 2004

Lecture 1  
Page 17

## Project Demos

- Must show working version of project to instructor
- Schedule time individually for this
- Must be done by middle of finals week

CS 239, Winter 2004

Lecture 1  
Page 18

## Project Deadlines

- Submit project proposal – January 30<sup>th</sup>
- Submit project update – February 27<sup>th</sup>
- Demonstration of project to instructor and project reports – March 24<sup>th</sup>

CS 239, Winter 2004

Lecture 1  
Page 19

## Tests

- Midterm – February 11
- Final – March 19 (3-6 PM)
- Both tests will be open book
  - Essay questions concentrating on applying knowledge

CS 239, Winter 2004

Lecture 1  
Page 20

## Office Hours

- MW 2-3
- Held in 3732J Boelter Hall
- Other times available by prior arrangement

CS 239, Winter 2004

Lecture 1  
Page 21

## Class Web Page

[www.lasr.cs.ucla.edu/classes/239\\_2.winter04](http://www.lasr.cs.ucla.edu/classes/239_2.winter04)

- Slides for classes will be posted there
  - By 5 PM the previous afternoon
  - In 6-up PDF form
- Readings will be posted there
  - With links to papers
- Also links to other interesting info

CS 239, Winter 2004

Lecture 1  
Page 22

## Introduction to Computer Security

- Why do we need computer security?
- What are our goals and what threatens them?

CS 239, Winter 2004

Lecture 1  
Page 23

## Why Is Security Necessary?

- Because people aren't always nice
- Because a lot of money is handled by computers
- Because a lot of important information is handled by computers
- Because our society is increasingly dependent on correct operation of computers

CS 239, Winter 2004

Lecture 1  
Page 24

## History of the Security Problem

- In the beginning, there was no computer security problem
- Later, there was a problem, but nobody cared
- Now, there's a big problem and people care
  - Only a matter of time before a real disaster
  - A company recently went out of business due to a DDoS attack

CS 239, Winter 2004

Lecture 1  
Page 25

## Some Examples of Large Scale Security Problems

- The Internet Worm
- Newer virus and worm attacks
- Distributed denial of service attacks
- Vulnerabilities in commonly used systems

CS 239, Winter 2004

Lecture 1  
Page 26

## The Internet Worm

- Launched in 1988
- A program that spread over the Internet to many sites
- Around 6,000 sites were shut down to get rid of it
- And (apparently) its damage was largely unintentional
- The holes it used have been closed
  - But the basic idea still works

CS 239, Winter 2004

Lecture 1  
Page 27

## Virus Attacks

- Multiple new viruses and worms appear every week
- The W32/Yaha-Y worm is a recent example
- Deletes certain system files
- Blocks web access to several virus protection sites
- Launches denial of service attack on several sites

CS 239, Winter 2004

Lecture 1  
Page 28

## Distributed Denial of Service Attacks

- Use large number of compromised machines to attack one target
  - By exploiting vulnerabilities
  - Or just generating lots of traffic
- Very common today
- Attacks are increasing in sophistication
- In general form, an extremely hard problem

CS 239, Winter 2004

Lecture 1  
Page 29

## The DNS DDoS Attack

- Attack on the 13 root servers of the DNS system
- Ping flood on all servers
- Interrupted service from 9 of the 13
- But did not interrupt DNS service in any noticeable way

CS 239, Winter 2004

Lecture 1  
Page 30

## Vulnerabilities in Commonly Used Systems

- 802.11 WEP is fatally flawed
- Vulnerabilities pop up regularly in Windows and Linux
- Many popular applications have vulnerabilities
- Many security systems have vulnerabilities

CS 239, Winter 2004

Lecture 1  
Page 31

## Electronic Commerce Attacks

- As Willie Sutton said when asked why he robbed banks,
  - “Because that’s where the money is”
- Increasingly, the money is on the Internet
- Criminals will follow
- Common problems:
  - Credit card number theft
  - Extortion for stolen on-line information
  - Identity theft
  - Manipulation of e-commerce sites

CS 239, Winter 2004

Lecture 1  
Page 32

## Some Recent Statistics

- From Computer Security Institute/FBI Computer Crime and Security Survey, 2003<sup>1</sup>
- 62% of respondents reported unauthorized use of their systems
  - 15% reported financial losses
- Total estimated losses by respondents: \$201 million
  - Primarily loss of proprietary info and costs of denial of service attacks

<sup>1</sup> Survey available at  
<http://www.security.fsu.edu/docs/FBI2003.pdf>

CS 239, Winter 2004

Lecture 1  
Page 33

## Results of a Recent Experiment

- Blackhole monitoring on a small (8 node) network<sup>1</sup>
- Detected 640 billion attack attempts over four month period
- At peak of Nimda worm’s attack, 2000 worm probes per second

<sup>1</sup> Unpublished research numbers from Farnham Jahanian, U. of Michigan, DARPA PTN PI meeting, January 2002.

CS 239, Winter 2004

Lecture 1  
Page 34

## But Do We Really Need Computer Security?

- The preceding examples suggest we must have it
- Yet many computers are highly insecure
- Why?
- Ultimately, because many people don’t think they need security
  - Or don’t understand what they need to do to get it

CS 239, Winter 2004

Lecture 1  
Page 35

## Why Aren’t All Computer Systems Secure?

- Partly due to hard technical problems
- But also due to cost/benefit issues
- Security costs
- Security usually only pays off when there’s trouble
- And, relatively speaking, the computer/network environment is still fairly benevolent
- Ignorance also plays a role
  - Increasing numbers of users are unsophisticated

CS 239, Winter 2004

Lecture 1  
Page 36

## Well, What About Tomorrow?

- Will security become more important?
- Yes!
- Why?
  - More money on the network
  - More sophisticated criminals
  - More leverage from computer attacks
  - More complex systems

CS 239, Winter 2004

Lecture 1  
Page 37

## What Are Our Security Goals?

- Confidentiality
  - If it's supposed to be a secret, be careful who hears it
- Integrity
  - Don't let someone change something they shouldn't
- Availability
  - Don't let someone stop others from using services
- Exclusivity
  - Don't let someone use something he shouldn't

CS 239, Winter 2004

Lecture 1  
Page 38

## What Are the Threats?

- Theft
- Privacy
- Destruction
- Interruption or interference with computer-controlled services

CS 239, Winter 2004

Lecture 1  
Page 39

## Thinking About Threats

- Threats are viewed as types of attacks on normal services
- So, what is normal service?

CS 239, Winter 2004

Lecture 1  
Page 40

## Classification of Threats

- Secrecy
- Integrity
- Availability
- Exclusivity

CS 239, Winter 2004

Lecture 1  
Page 41

## Interruption

The information never reaches the destination

CS 239, Winter 2004

Lecture 1  
Page 42

## Interruption Threats

- Denial of service
- Prevents source from sending information to receiver
- Or receiver from sending requests to source
- A threat to availability

CS 239, Winter 2004

Lecture 1  
Page 43

## How Do Interruption Threats Occur?

- Destruction of hardware, software, or data
- Interference with a communications channel
- Overloading a shared resource

CS 239, Winter 2004

Lecture 1  
Page 44

## Interception

CS 239, Winter 2004

Lecture 1  
Page 45

## Interception Threats

- Data or services are provided to an unauthorized party
- Either in conjunction with or independent of a legitimate request
- A threat to secrecy
- Also a threat to exclusivity

CS 239, Winter 2004

Lecture 1  
Page 46

## How Do Interception Threats Occur?

- Eavesdropping
- Masquerading
- Break-ins
- Illicit data copying

CS 239, Winter 2004

Lecture 1  
Page 47

## Modification

CS 239, Winter 2004

Lecture 1  
Page 48

## Modification Threats

- Unauthorized parties modify the data
- Either on the way to the users
- Or permanently at the servers
- A threat to integrity

CS 239, Winter 2004

Lecture 1  
Page 49

## How Do Modification Threats Occur?

- Interception of data requests/replies
- Masquerading
- Break-ins
- Flaws in applications allowing unintended modifications
- Other forms of illicit access to servers and their services

CS 239, Winter 2004

Lecture 1  
Page 50

## Fabrication

CS 239, Winter 2004

Lecture 1  
Page 51

## Fabrication Threats

- Unauthorized parties insert counterfeit objects into the system
- Causing improper changes in data
- Or improper use of system resources
- Or other bad behavior
- A threat to integrity
  - And possibly exclusivity

CS 239, Winter 2004

Lecture 1  
Page 52

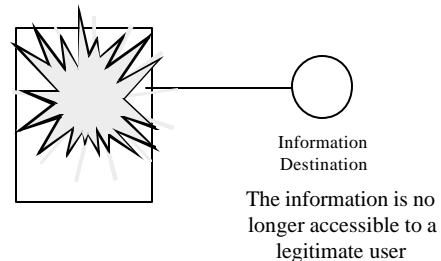

## How Do Fabrication Threats Occur?

- Masquerading
- Bypassing protection mechanisms
- Duplication of legitimate requests/responses

CS 239, Winter 2004

Lecture 1  
Page 53

## Destruction Threats

CS 239, Winter 2004

Lecture 1  
Page 54

## Destruction Threats

- Destroy data, hardware, messages, or software
- Often easier to destroy something than usefully modify it
- Often (but not always) requires physical access

CS 239, Winter 2004

Lecture 1  
Page 55

## Active Threats Vs. Passive Threats

- *Passive threats* are forms of eavesdropping
  - No modification, injections of requests, etc.
- *Active threats* are more aggressive
- Passive threats are mostly to secrecy
- Active threats are to all properties

CS 239, Winter 2004

Lecture 1  
Page 56

## Social Engineering and Security

- The best computer security practices are easily subverted by bad human practices
  - E.g., giving passwords out over the phone to anyone who asks
- Social engineering attacks tend to be cheap, easy, effective
- So all our work may be for naught

CS 239, Winter 2004

Lecture 1  
Page 57

## Social Engineering Example

- In 2002, attackers on IRC/IM services tried this kind of attack<sup>1</sup>:
  - Convince users to manually download dangerous code
  - “You are infected with a virus that lets hackers get into your machine and read ur files, etc. I suggest you to download <malicious URL> and clean ur infected machine. Otherwise you will be banned from <IRC network>.”
  - If you downloaded it, your machine was taken over

<sup>1</sup> More details at  
[http://www.cert.org/incident\\_notes/IN-2002-03.html](http://www.cert.org/incident_notes/IN-2002-03.html)

CS 239, Winter 2004

Lecture 1  
Page 58

## Why Isn't Security Easy?

- Security is different than most other problems in CS
- The “universe” we’re working in is much more hostile
- Human opponents seek to outwit us
- Fundamentally, we want to share secrets in a controlled way
  - A classically hard problem in human relations

CS 239, Winter 2004

Lecture 1  
Page 59

## What Makes Security Hard?

- You have to get everything right
  - Any mistake is an opportunity for your opponent
- When was the last time you saw a computer system that did everything right?
- So, must we wait for bug-free software to achieve security?

CS 239, Winter 2004

Lecture 1  
Page 60

## Security Is Actually Even Harder

- The computer itself isn't the only point of vulnerability
- If the computer security is good enough, the foe will attack:
  - The users
  - The programmers
  - The system administrators
  - Or something you never thought of

CS 239, Winter 2004

Lecture 1  
Page 61

## A Further Problem With Security

- Security costs
  - Computing resources
  - People's time and attention
- If people use them badly, most security measures won't do the job
- Security must work 100% effectively
- With 0% overhead or inconvenience or learning

CS 239, Winter 2004

Lecture 1  
Page 62

## The Principle of Easiest Penetration

- *An intruder must be expected to use any available means of penetration. This is not necessarily the most obvious means, nor is it necessarily the one against which the most solid defense has been installed.*
- Put another way,
  - The smart opponent attacks you where you're weak, not where you're strong

CS 239, Winter 2004

Lecture 1  
Page 63

## But Sometimes Security Isn't That Hard

- The Principle of Adequate Protection:
  - *Computer items must be protected only until they lose their value. They must be protected to a degree consistent with their value.*
- So worthless things need little protection
- And things with timely value need only be protected for a while

CS 239, Winter 2004

Lecture 1  
Page 64

## Conclusion

- Security is important
- Security is hard
- A security expert's work is never done
  - At least, not for very long
- Security is full-contact computer science
  - Probably the most adversarial area in CS
- Intensely interesting, intensely difficult, and "the problem" will never be solved

CS 239, Winter 2004

Lecture 1  
Page 65
